### **3D Demonstrator Points to Innovation in Land Information**

Landgate and ISA Technologies have partnered to develop a 3D Demonstrator which will display Landgate's statutory information, such as strata titles, in a new and innovative way.

The 3D Demonstrator, which was showcased at the Western Australian Land Information System (WALIS) International Forum 08 in Perth last week, provides an example of a multi-storey building layered with strata title information.

Landgate's Information Access Executive Director Mike Bradford said the development of the 3D Demonstrator provided both Landgate and ISA Technologies an opportunity to come together to explore innovative ways of delivering strata title information in a 3D format.

"3D visualisation of land information has become an increasing focus of major multinational technology companies," Mr Bradford said.

"As Western Australia's Land Information Authority, Landgate is keen to display its statutory information such as strata titles in a new way, providing viewing realism and ease of access for customers."

The 3D Demonstrator project showcases the capability of ISA Technologies, a leading Western Australian information technology company which focuses on 3D visualisation and high performance computing.

The project has also been supported by 3D Millipede, an animation group based in WA.

ISA Technologies Managing Director Sil La Puma said the project provided an opportunity to promote Western Australian innovative solutions and new approaches to technology.

“Western Australia is a large state with a relatively concentrated, small population. It is ideally suited to the development of 3D visual solutions and services that support new ways of accessing land information,” Mr La Puma said.

Mr Bradford said Landgate has supported the development of the 3D Demonstrator as part of its increasing focus on innovation in Western Australia.

“Landgate is committed to increased investment in research, development and innovation,” he said.

“Our work with ISA Technologies in the development of the 3D Demonstrator reflects our commitment to improve access to, and delivery of, land information.”
